Introduction to Agent-Based Simulation

Modeling complex systems

What is agent-based simulation?

- .Also called individual-based modeling
- .Bottom-up approach
 - Modeling the trees not the forest
- .Characteristics
 - Local interaction
 - Emergent behavior

Agent-based simulation is very versatile

Agent-based simulation is very versatile (cont.)

Table 1: A sample of recent agent-based applications

Application Area:	Agent-based Model Focus:
Agriculture	A spatial individual-based model prototype for assessing potential pesticide exposure of farm-workers conducting small-scale agricultural production (Leyk et al. 2009)
Air Traffic Control	Air traffic control to analyze control policies and performance of an air traffic management facility (Conway 2006)
Anthropology	Prehistoric settlement patterns and political consolidation in the Lake Titicaca basin of Peru and Bolivia (Griffin and Stanish 2007)
Biomedical Research	<i>The Basic Immune Simulator</i> , to study the interactions between innate and adaptive immunity (Folcik et al. 2007)
Crime Analysis	A realistic virtual urban environment, populated with virtual burglar agents (Malleon 2010)
Ecology	Investigate the trade-off between road avoidance and salt pool spatial memory in the movement behavior of moose (Grosman et al. 2011) Predator-prey relationships between transient killer whales and other marine mammals (Mock and Testa 2007)
Energy Analysis	A building occupant network energy consumption decision-making model (Chen et al. 2011) Application for the Smart Grid (Jackson 2010) Energy investment decision making (Tobias 2008) Oil refinery supply chain (Van Dam et al. 2008)
Epidemiology	Pandemic disease model accounting for individual behavior and demographics (Aleman et al. 2010) Global-scale agent model of disease transmission (Parker and Epstein 2011)
Evacuation	Tsunami evacuation using a modified form of Helbing's social-force model applied to agents (Puckett 2009)
Market Analysis	Consumer marketing model developed in collaboration with a Fortune 50 firm (North et al. 2009) Consumer airline market share (Kuhn et al. 2010) Simulation that models the possibilities for a future market in sub-orbital space tourism (Charania et al. 2006)
Social Networks	Model of email-based social networks, in which individuals establish, maintain and allow atrophy of links through contact-lists and emails (Menges et al. 2008)

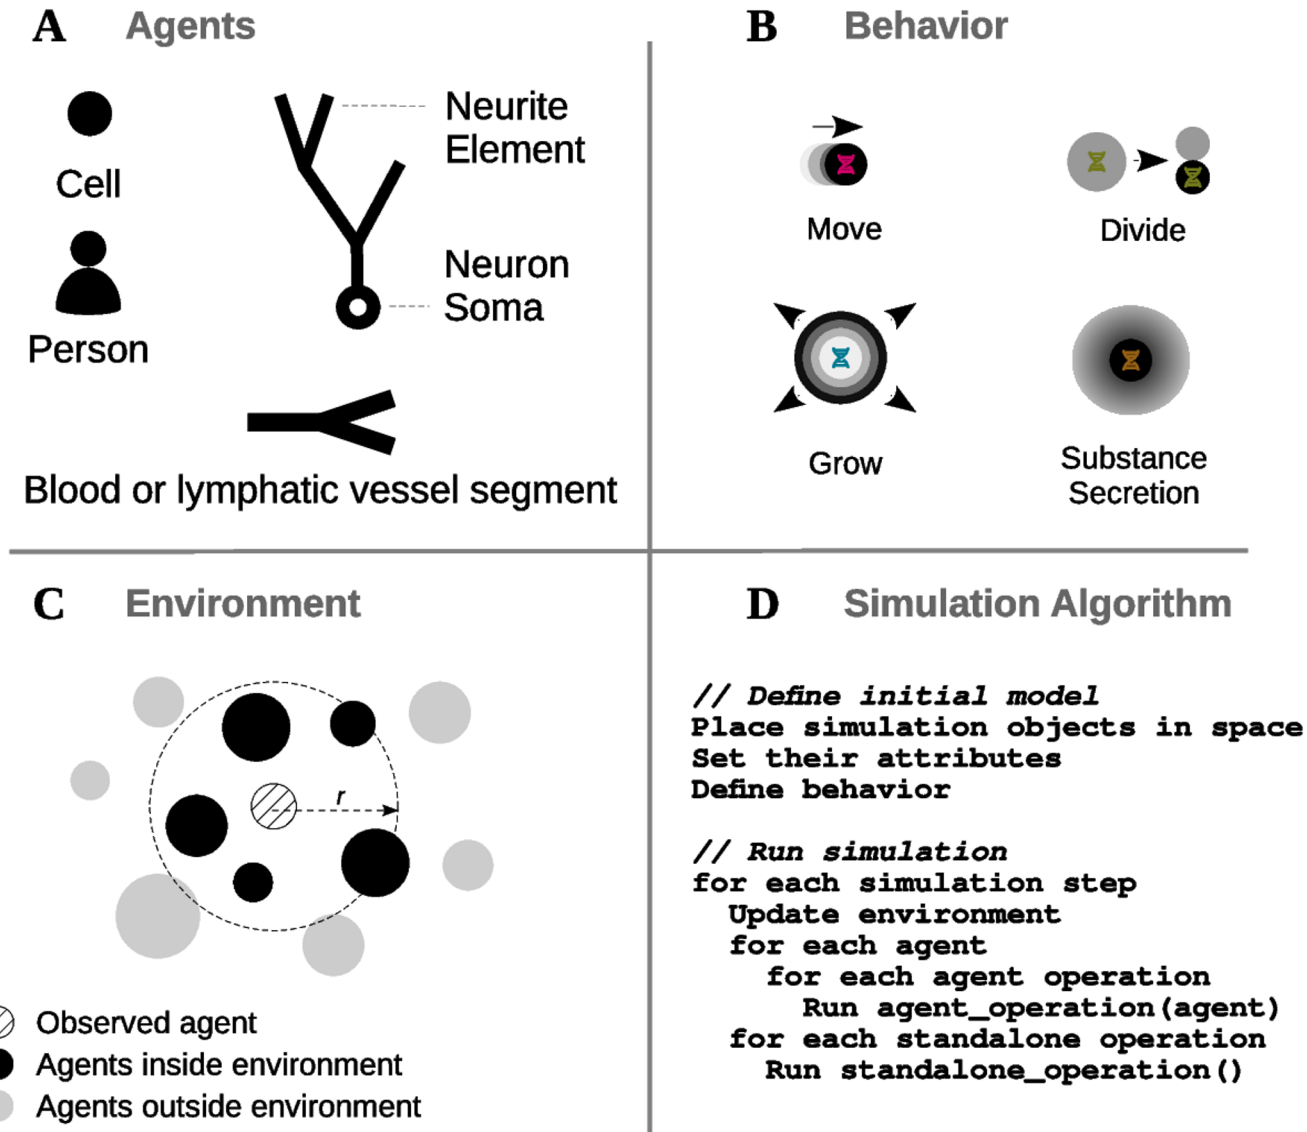

Rising Number of Publications in this field

.Keywords used:

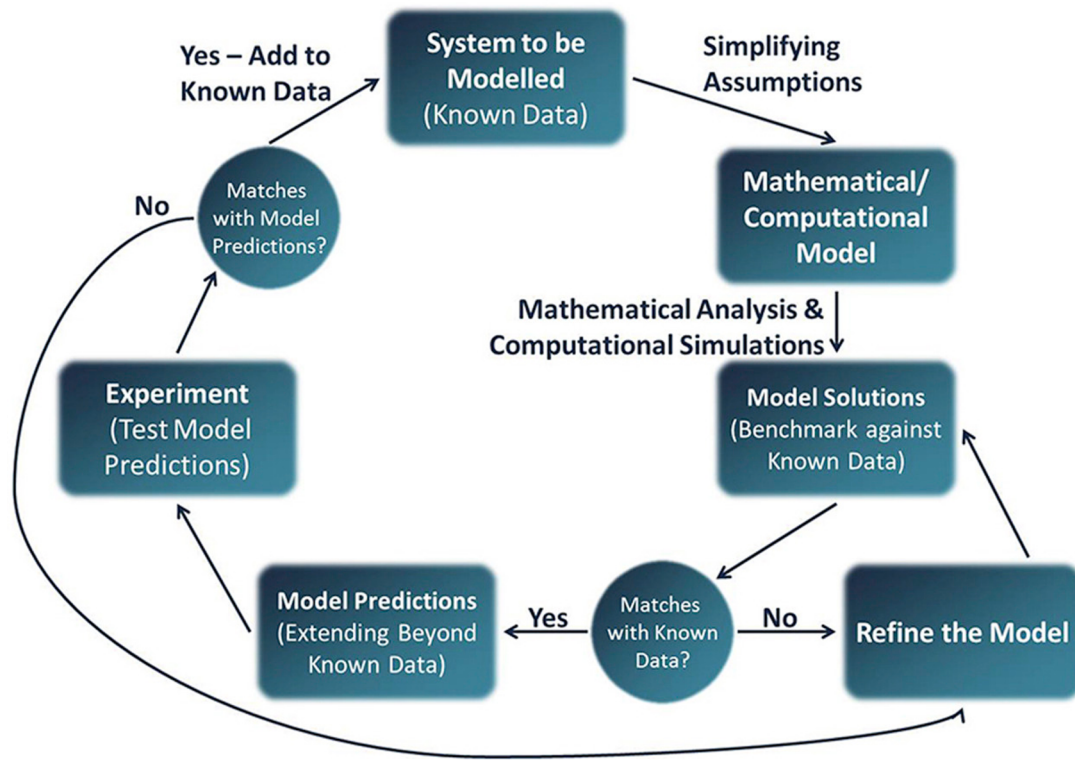

“agent-based modeling” or “agents-based simulation”

Important building blocks

The process of developing an ABM

Demo

Cell clustering model

- Agent: Cell
 - Spherical shape
 - cell type
- Behaviors
 - Secrete a substance into the extracellular matrix
 - Follow the concentration gradient (chemotaxis)
- Initial condition
 - Randomly distributed in 3D space

Cell clustering video

Cell clustering result

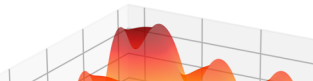

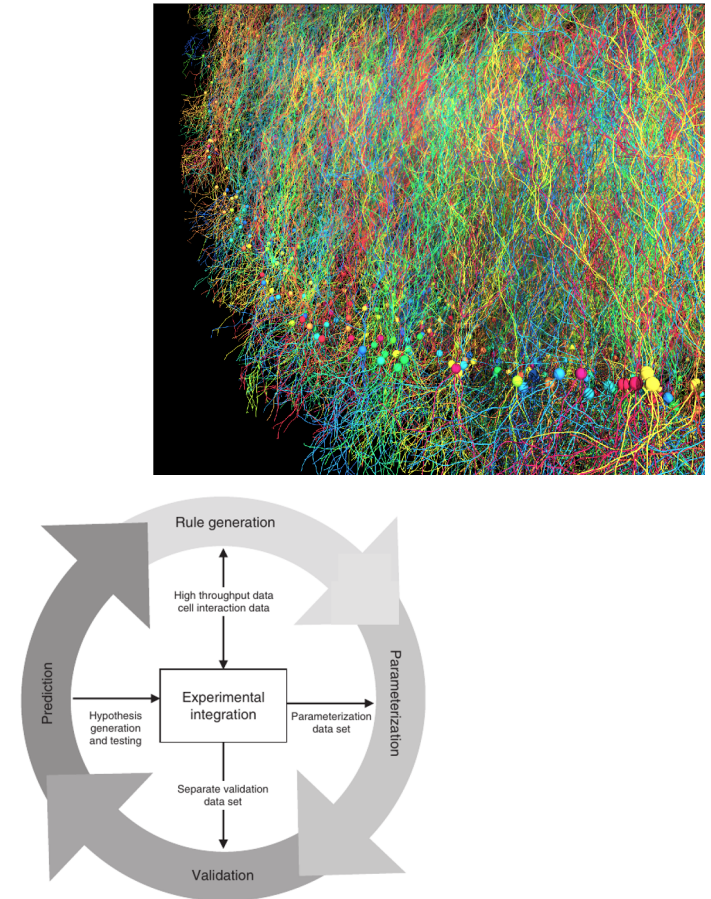

Performance considerations

The problem

Existing simulation platforms do not always take full advantage of modern hardware.

Impact of low performance

- Limitation of the size and complexity of models
 - Longer development time
 - Limited capability to explore parameter space
→ less optimal solution
 - Increased cost
- 

Our solution

BioDynaMo a **high-performance and modular, agent-based** simulation platform written in C++.

Features and abstraction layers

Simulation

- **Agent geometry:** sphere, cylinder
- **Agents:** Cell, NeuronSoma, NeuriteElement
- **Behaviors:** Secretion, Chemotaxis, Proliferation, GeneRegulation
- Extracellular diffusion
- Agent interaction force

Simulation

BioDynaMo's model building blocks

- Generation of agent populations
- Agent reproduction & mortality
- Environment search
- Multi-scale simulations
- Dynamic scheduling
- Statistical analysis
- Parameter management
- Parameter optimization
- Hierarchical model support
- Hybrid-modeling
- Space boundary conditions

BioDynaMo's high-level features

- Parallelism & thread-safety
- Performance optimizations
- GPU support
- Visualization
- Web-based interface
- Backup & restore of simulations
- Quality assurance infrastructure

BioDynaMo's low-level features

OpenMP

ROOT

ParaView

Others

Libraries

Linux / MacOS

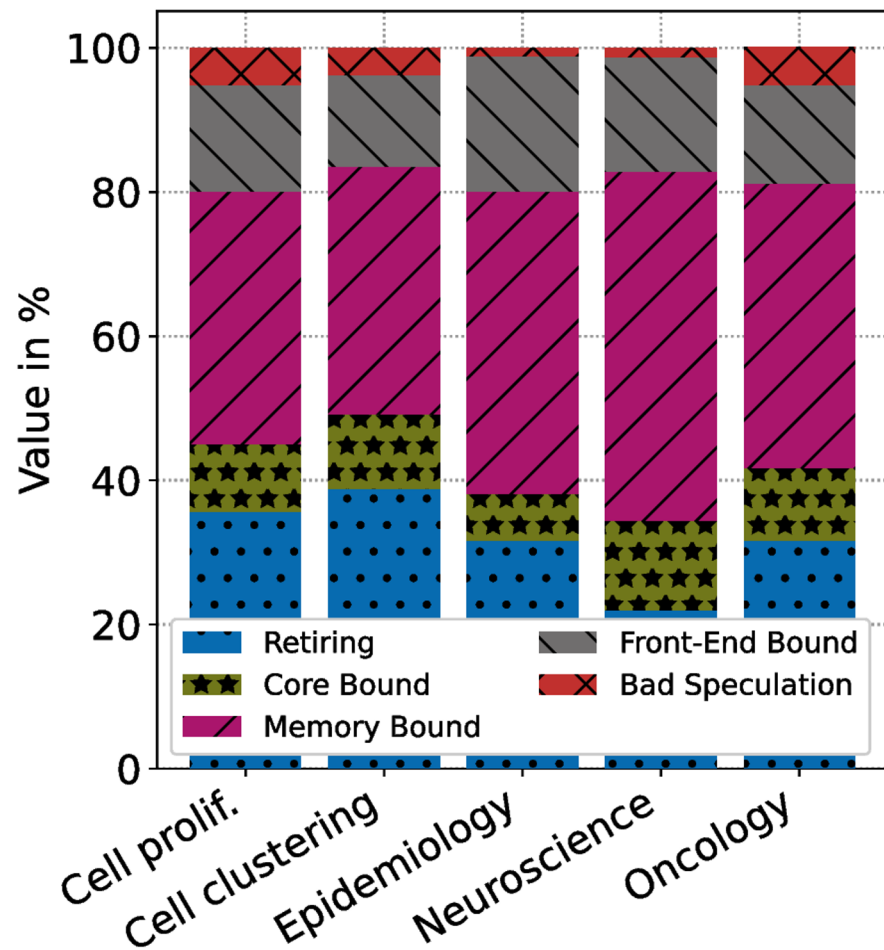

Operating System

(Multi-core) CPUs

GPU

Hardware

Challenge: Agent-based workload is memory-bound

Required efficient agent-based primitives

- .Iterate over agents and execute operations
- .Add and remove agents to/from the simulation
- .Efficient environment implementation

Algorithm 1: Agent-based simulation algorithm

```
1 ModelInitialization()
2 for  $i \in iterations$  do
3   for  $op \in pre\_standalone\_operations$  do
4     |  $op()$ ;
5   end
6   wait()
7   parallel for  $a \in agents$  do
8     | for  $op \in agent\_operations$  do
9       | |  $op(a)$ ;
10    | end
11  end
12  for  $op \in standalone\_operations$  do
13    |  $op()$ ;
14  end
15  wait()
16  for  $op \in post\_standalone\_operations$  do
17    |  $op()$ ;
18  end
19 end
```

Performance Challenges and Improvements

- Maximize parallelization
 - Optimized uniform grid to search for neighbors
 - Parallelize the addition and removal of agents
- Efficient thread synchronization during agent updates
- Minimize memory access latency
 - NUMA-aware iteration
 - Agent Sorting and Balancing
 - Pool-based memory allocator
- Offload computation to the GPU

Maximize parallelization

Optimized uniform grid to search for neighbors

Uniform Grid

Kd-Tree

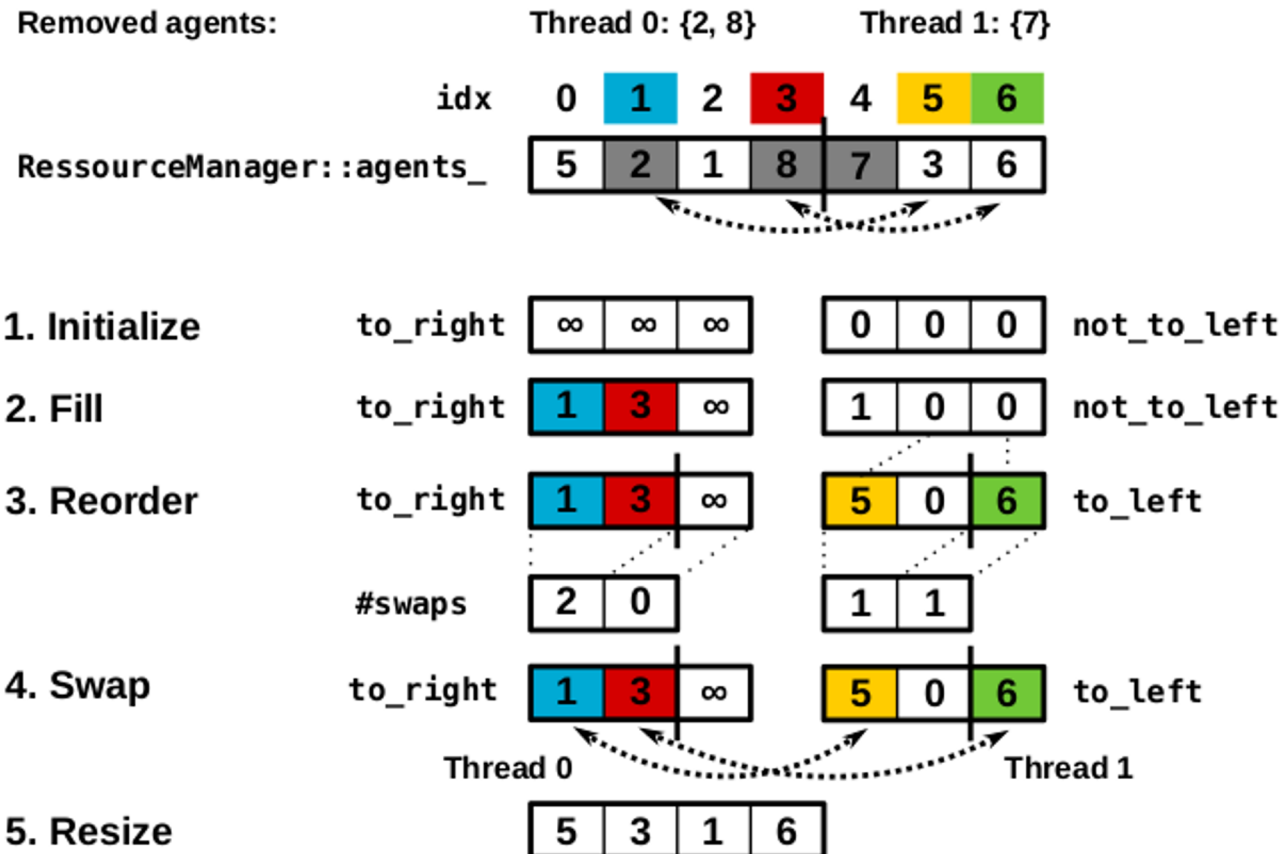

Quadtree

Delaunay Triangulation

Parallel agent removal mechanism

Optimize Thread-Synchronization

Thread-synchronization (TS) during agent-updates

Algorithm 1: Agent-based simulation algorithm

```
1 ModelInitialization()
2 for  $i \in \text{iterations}$  do
3   for  $op \in \text{pre\_standalone\_operations}$  do
4      $op()$ ;
5   end
6   wait()
7   parallel for  $a \in \text{agents}$  do
8     for  $op \in \text{agent\_operations}$  do
9        $op(a)$ ;
10    end
11  end
12  for  $op \in \text{standalone\_operations}$  do
13     $op()$ ;
14  end
15  wait()
16  for  $op \in \text{post\_standalone\_operations}$  do
17     $op()$ ;
18  end
19 end
```

T0

T1

• Only necessary if agents modify their local environment.

– Two agents (updated by two different threads) could attempt to modify the same neighbor.

• BioDynaMo provides two TS mechanisms

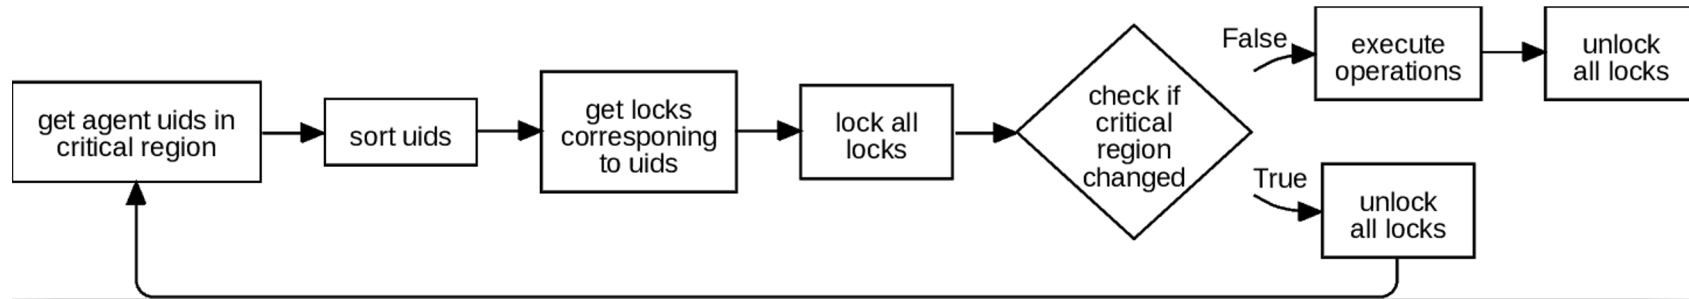

– Automatic TS

– User-defined TS

Automatic thread-synchronization

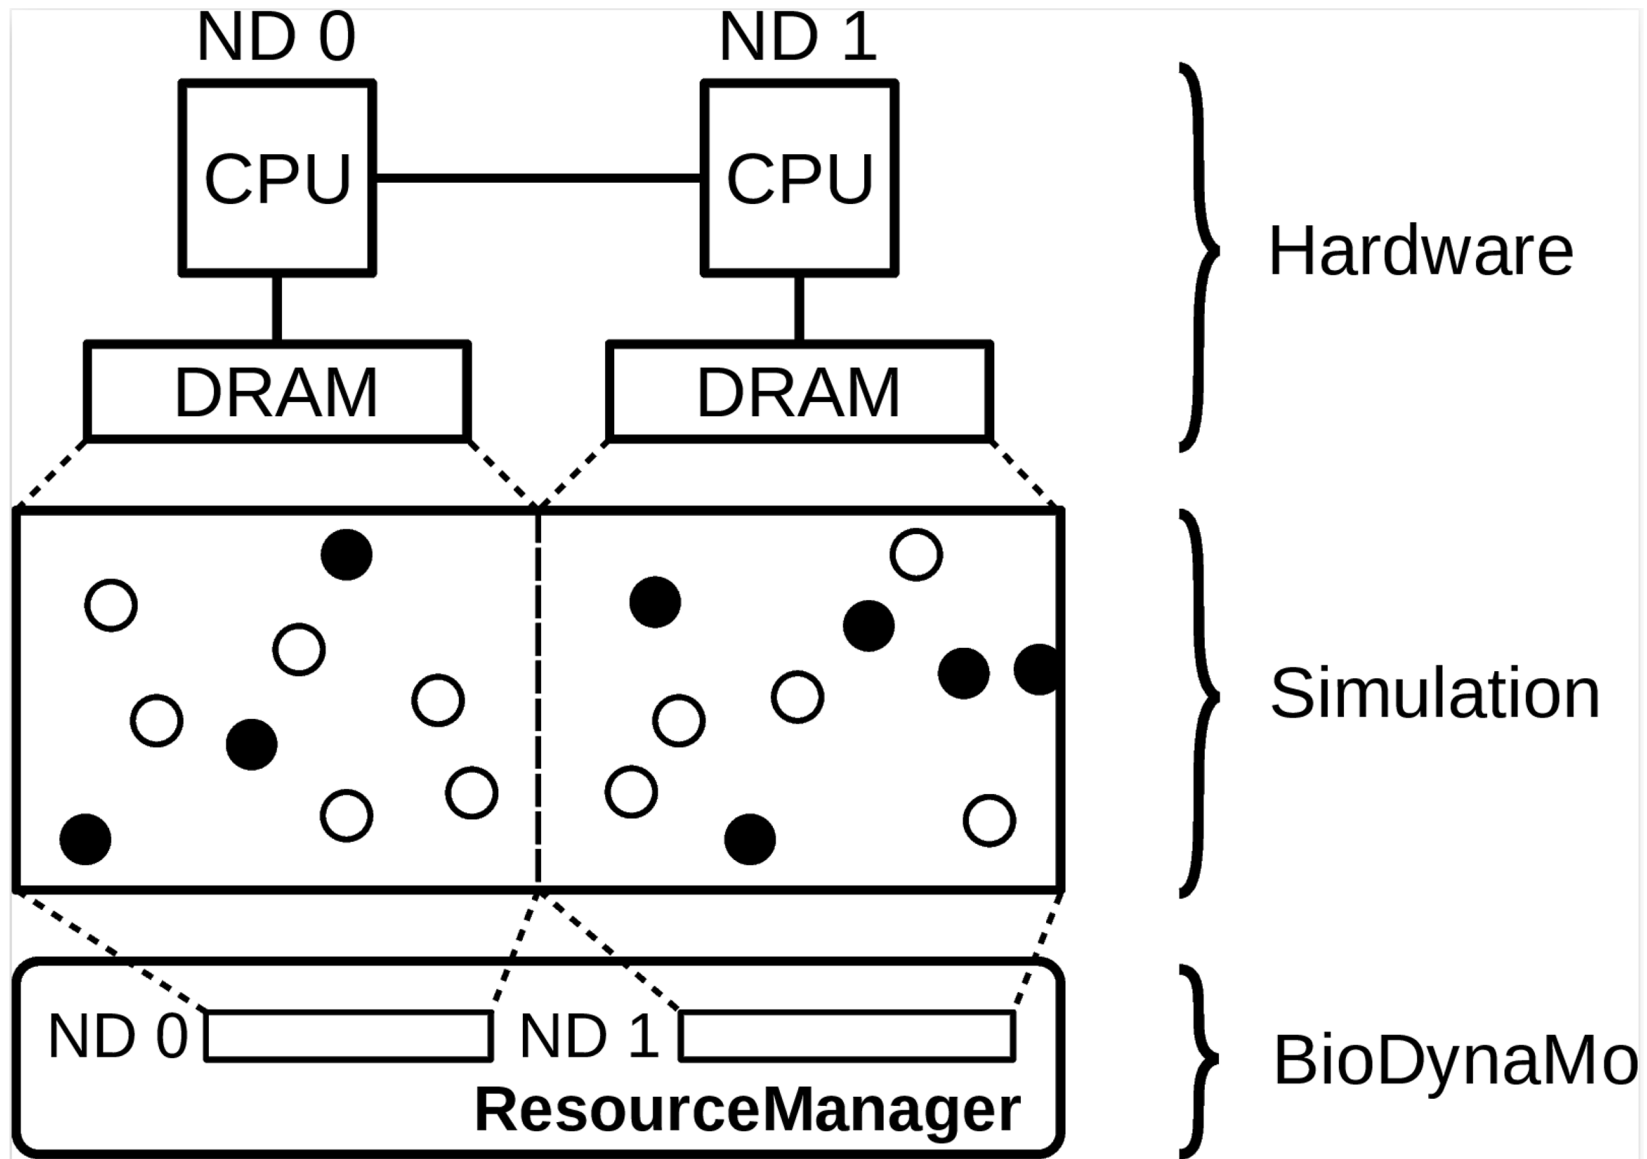

User-defined thread-synchronization

```
void NeuronSoma::CriticalRegion(std::vector<AgentPointer<>>* aptrs) {  
    aptrs->reserve(daughters_.size() + 1);  
    aptrs->push_back(Agent::GetAgentPtr<>());  
    for (auto& daughter : daughters_) {  
        aptrs->push_back(daughter);  
    }  
}
```

Minimize Memory Access Latency

NUMA-aware iteration

Agent sorting and balancing mechanism

A Agents in 3x3 grid

	x	0	1	2
y	0		a	e
	1	b	c,d	f
	2	g,h,i		j

B Grid box indices

	x	0	1	2
y	0	0	1	2
	1	3	4	5
	2	6	7	8

C Morton order of 4x4 grid

	x	0	1	2	3
y	0	0	1	4	5
	1	2	3	6	7
	2	8	9	12	13
	3	10	11	14	15

D Determine offsets

		x[0,3] y[0,3]															
		x[0,1] y[0,1]		x[2,3] y[0,1]		x[0,1] y[2,3]		x[2,3] y[2,3]									
box	Morton code	0-3	4	5	6	7	8	9	10	11	12	13	14	15			
box	counter	0	4	5	5	6	6	7	8	8	8	9	9	9			
	offset	0	0	0	1	1	2	2	2	3	4	4	5	6			
	found gap	T	F	F	T	F	T	F	F	T	T	F	T	T			

offsets {0,0}{5,1}{6,2}{8,4}

E Determine Morton order

index	0	1	2	3	4	5	6	7	8
+ offsets					0	1	2		4
= Morton order	0	1	2	3	4	6	8	9	12

F Partition

agents per box	0	1	1	2	1	1	3	0	1
prefix sum	0	1	2	4	5	6	9	9	10

G Sort and balance

BioDynaMo Memory Allocator

A Layout

B Deallocation

Offload computation to the GPU

BioDynaMo's GPU capabilities

.Operations can have implementations for different compute targets (CPU, GPU, and FPGA).

.If an operation has multiple implementations, the scheduler decides which one to use.

.Currently, BioDynaMo provides a GPU operation to calculate mechanical forces between spheres.

$$\begin{aligned}\delta &= r_1 + r_2 - \|p_1 - p_2\| \\ r &= \frac{r_1 \cdot r_2}{r_1 + r_2} \\ F &= (\kappa \cdot \delta - \gamma \cdot \sqrt{r \cdot \delta}) \cdot \frac{p_1 - p_2}{\|p_1 - p_2\|}\end{aligned}$$

Collision force computation

Performance Evaluation

Benchmark simulations

Benchmark simulations characteristics

Characteristic	Cell proliferation	Cell clustering	Epidemiology use case	Neuroscience use case	Oncology use case
Create new agents during simulation	X			X	X
Delete agents during simulation					X
Agents modify neighbors				X	
Load imbalance			X	X	
Agents move randomly			X		X
Simulation uses diffusion		X		X	
Simulation has static regions				X	
Number of iterations	500	1000	1000	500	288
Number of agents (in millions)	12.6	2	10	9	10
Number of diffusion volumes	0	54m	0	65k	0

Benchmark hardware

TABLE II: Benchmark hardware

System	Main memory	CPU	OS
A	504 GB	Server with four Intel(R) Xeon(R) E7-8890 v3 CPUs @ 2.50GHz with a total of 72 physical cores, two threads per core and four NUMA nodes.	CentOS 7.9.2009
B	1008 GB		
C	62 GB	Server with two Intel(R) Xeon(R) E5-2683 v3 CPUs @ 2.00GHz with a total of 28 physical cores, two threads per core and two NUMA nodes.	CentOS Stream 8

Runtime and Memory Complexity

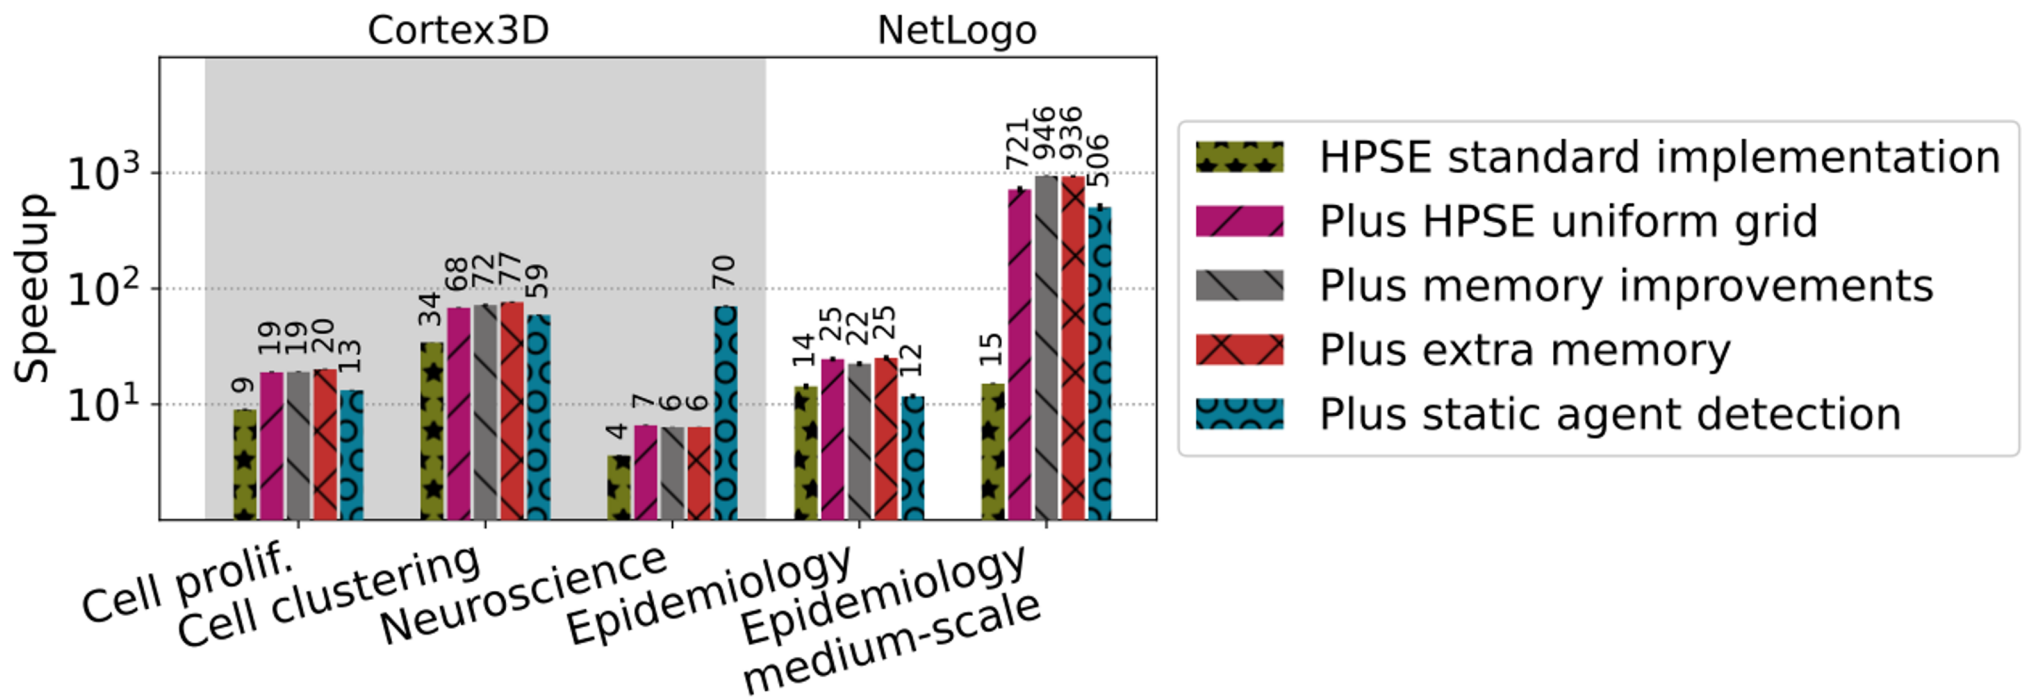

Comparison with Biocellion

•Single-node 16 CPU cores; 13.4 million cells
→ BioDynaMo is **4.15x faster**

•Biocellion: 21 nodes, 672 CPU cores, 281 million cells
BioDynaMo: one node, 72 CPU cores
→ same runtime, but **9.3x fewer CPU cores** used

Comparison with Cortex3D and NetLogo

Scalability

Agent Sorting and Balancing

Ongoing Use Cases

Retinal self-organization

.Understand the mechanisms of cells self-organization during early development which is pivotal for their function.

Radiation-induced lung injury simulation

.Simulate onset of radiation pneumonitis and/or lung fibrosis in normal tissue after exposition to thoracic irradiation.

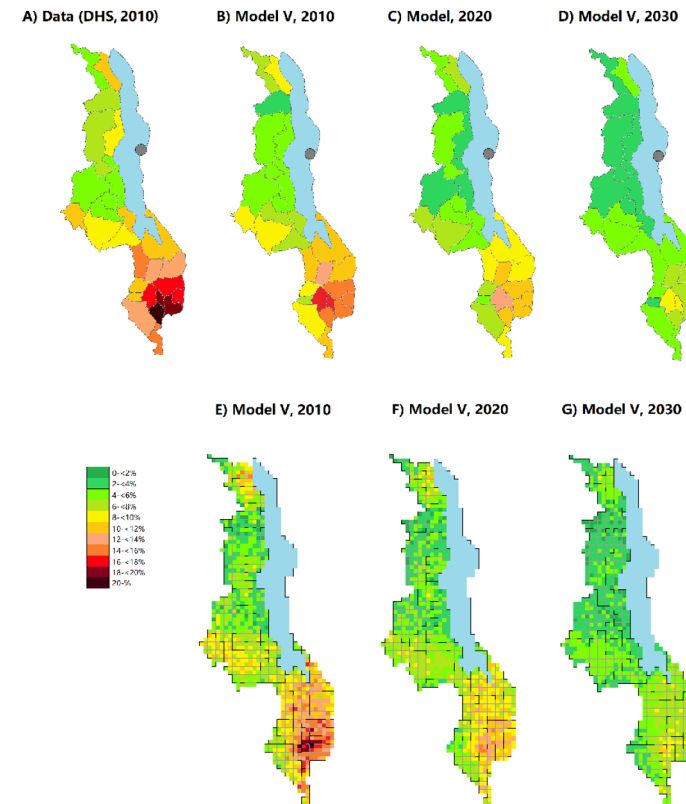

Spatial Spread of HIV in Malawi

- Collaboration with UniGE
- Original simulation written in R (Runtime: ~5.5h)
- Goal: speed up execution time
- Preliminary runtime with BioDynaMo: less than **2 minutes**
- Further work needed to make models equivalent

The spatial spread of HIV in Malawi: An individual-based mathematical model

 Janne Estill, Wingston Ng'ambi, Liudmila Rozanova, Olivia Keiser

doi: <https://doi.org/10.1101/2020.12.23.20248757>

Summary

- .Agent-based simulation can be used to model many systems
- .The presented optimizations improve the performance over state-of-the-art
 - Up to **three orders of magnitude speedup**
- .These improvements allow BioDynaMo simulating **billions of agents** on a single server
- .BioDynaMo is currently being used in:
 - neuroscience
 - oncology
 - epidemiology
 - cryobiology
 - socioeconomics
 - finance
 - ...
